

FCE's: Overview

- Types / variations on FCE's
- Questions referral sources may ask
- The report: Questions you should answer
- Current Legal Issues
 - Ramifications under Title 1 of ADAAA
 - Therapist clearly responsible to understand

Work Oriented Evaluations:

1. Functional / Physical Capacity Evaluation

- Focus: general information about UE function
- May include simulation of some work functions
- Not specific to target occupation
- or Simulates components of target occupation but not all – define clearly and why

Basic Elements:

- As Karen covered:
- Symptoms
- Musculoskeletal examination, general /tissue specific
- “Mobile” standardized tests
- Positional tolerance

Tissue Specific Evaluation

- +/- specific job goal / target occupation
- Evaluation of functional capacity / focus body part capacity
- May exclude some physical demands not directly related to tissue / diagnosis or not related to work needs – DOCUMENT!

Same basic elements

- More focused upper quarter musculoskeletal screening
- May include more specific functional tests:
 - Coordination
 - Sustained reach
 - Overhead reach
 - Fine coordination/hand endurance
- Other elements as relate

Functional Job Description

- Required for:
 - Targeted Occupation Evaluation
 - Post offer / pre placement Evaluation
- Without good job description: may be ADA legal implications for testing & conclusions: state it

A Good Job Description is essential to a good occupation specific FCE and POS / PPE - Matheson

Job Descriptions: ADA, FMLA, WC

- “a carefully written job description that include essential functions is perhaps the best piece of documentary evidence to submit to a court identifying the essential functions of the job”
- “at the same time, an outdated or incomplete job description may be worse than none at all” – Duston et al.
- Good Job description essential to good FCE**

Functional Job Descriptions should include:

- Job Title
- Job Objective
- Essential functions
- Other duties or non-essential functions
- **Qualifications
- Required knowledge
- Physical demands for essential functions

Determining Essential Functions

- Does the position exist to perform this function
- How many employees available to perform the function
- Is the function highly specialized
- How much time is spent performing the function

Determining Essential Functions (cont.)

- What is the consequence of not performing the function
- How does collective bargaining affect the function
- Are current or prior employees required to do the function
- What is the employer’s judgment about the function
- The Job Description**

Beware: PD Language problems

- Assist in direction of store operation
- Supervise daily operations
- Implement multiple tasks

Physical Demands tested:

- Must relate to the Essential Functions
- Should be measurable
 - Ft, Lbs, Heights etc.
- Keep job specific to avoid discriminatory language
 - move vs. carry
 - place vs. lift
- Frequency, duration issues
- For Job Specific FCE, physical demands should relate to actual job metrics

Risk Factors definitions:

- Repetition
 - Hand / wrist: 900 motions / hour (ANSI, 1997)
 - Shoulder: 90 motions / hour (ANSI, 1997)
 - 13000 fundamental wrist motions / 8hr shift (Silverstein, 1987)
 - one action every 15 seconds (Barr et al, 1999)
 - Same motion every few seconds/2 hours(OSHA, 2000)
- Force: (Washington State Hazard Zone, 2000)
 - grip: 10 lbs. unsupported or with force 10 lbs. or more
 - pinch: unsupported object 2 lbs or more, or with force 4 lbs. or more

Reports:

- Examples on website
- Physical Demands Analysis
 - (Resource: Industrial Accident Prevention Association, Canada)

Fit for Duty / Post Offer Screen / Pre-Placement Testing

- Determines ability to perform essential functions of the job
- Must be based on an Essential Work Functions from FJD
- Screens for pre-existing conditions that might place worker at risk (Schultz) and that may require accommodation
- Done post offer / pre placement

PPS / PPT

- Goal: avoid employee injury / not discriminate
- Shorter
- Very task specific
- May identify need for
 - Additional evaluation
 - Work station abatements

9 Steps to defend POT (Matheson)

1. Understand Agency Relationship
2. Be up to date on terminology / EF
3. Segment protocol: safety, demonstrated ability / relate to EF's
4. Understand current concept on frequency – based on job metrics
5. Isometric vs. Isoinertial vs. Pure Functional

(Matheson 9 Key steps cont.)

- 6. Document protocol
- 7. Validate protocol
- 8. Keep records private
- 9. Stay in compliance with the law

Situational / On-Site Evaluation

- Duplicates elements of the target occupation
- Places the client in the actual work situation
- Will include specific skills, physical demands, tool use etc.

Work environment

- Conference room
- Cafeteria / break room
- Office
- Actual production floor
- Challenges:
 - Limited space
 - Non-standard surfaces / space
 - Must bring all equipment for screening
 - Weights
 - Floor surfaces
 - Psychosocial concerns

Onsite FCE

- Allows validation of work tasks / Functional Job Description
- Allows use of actual tools / parts
- Allows suggestions for abatements / assistive devices
- Allows "job coaching" for injured employee
- Provides MD with "eyes on site" – what the employee must v. perceives must do

What do I take?

- All MS eval components: goniometer, dynamometer, pinch gauge, sensory equipment, volumeter
- Coordination tests: MRMT, Purdue, 9-hole peg
- Heart rate monitor
- Functional tests
- Weight box / up to 50 lbs.
- Tool box
- Push pull gauge

What do I use there?

- Actual tools / equipment once MS screen is complete
- Actual work stations / heights
- Stairs / shelves, etc for physical placement of tests
- Actual walking surfaces
- Actual carts used to move equipment
- Actual work positions

Case Study:

- 57 year old right dominant male
- R rotator cuff repair, hx left rotator cuff
- Janitor and truck washer at large truck sales center
- Completed full PT program / strengthening
- MD concern re: perform all aspects of work

Questions carriers should ask you: Scheduling

- Facility definitions of types of evals
 - FCE
 - PCE
 - WCE
 - Job specific eval?
- Do you use a "brand" of FCE?
 - Does it fit their needs?

Qualifications about the Examiner: be prepared to answer

- No Who will actually do the eval
 - No Amount of supervision?
 - Experience of that person?
- Provide a CV
 - Training in FCE?
 - Experience – may need to request separately - #/month or #/year

You should provide (Schulaha, 2010):

- Summary of findings at beginning
 - Basis for conclusions
- Brief pertinent history
- Subjective statements
- Summary of objective musculoskeletal screen related to diagnosis
- Test protocols
- Observations
- Functional tests performed

What should be supplied to you?

- "Complete" medical records
- Specific questions
- Job related information (FJD!) if job specific evaluation

Questions to answer:

- Time spent with patient / breaks and why?
- Were pain behaviors observed? If so, Why?
- What was the level of cooperation / attitude
- Is there evidence of cardiovascular/effort monitoring
- What body mechanics / movement patterns observed
- What postural observations – How related to tissue or not related

Questions to answer cont.

- What reasons tests were d/c'd
 - Psychophysical vs. Kinesiophysical
- Were inconsistencies noted / behavioral observations
 - were they consistent within tests, relative to diagnosis?
- What consistency of effort tests done?
 - How did test outcomes impact conclusions?

Work related questions

- Define DOT level of function, but be job specific in documentation
- What were abilities / limitations? Did they reflect maximal / optimal or minimal level?
- Did abilities and job demands correlate? If not, how did they deviate?
- Did fatigue and de-conditioning affect performance?
- Are limitations related to other dx?

Possible Accommodations / Recommendations:

- Ergonomic abatements
- Alternate work methods
- Return to work sequence
- ? Job Shadowing

Findings / Recommendations: (case study)

- “excellent outcome both from surgical and conservative management”
- “lifting abilities into the Heavy Work category” (define weight)
- and “demonstrated /employer confirmed all work elements with modified acceptable methods or requested assistance”
- “physical capacity to perform the physical demands”

Recommendations:

- “Encouraged to continue to make use of all assistive / lift devices available”
- “Encouraged request assistance with heavier lifting (delivered tires)”

Medical-legal issues:

- Scrutinized
- Standardized to a certain extent, but construct validity is better with deviation for some parts
- Objectivity and clear documentation vital
- If Specific Job, testing and suggestions must reflect essential functions / physical demands

Medical / Legal Cont.

- Who is your customer?
 - Ethics of evaluating your own patient
 - Remain objective
 - Remember the goal of rehab: Return to Work
- Helping all parties

Don't promise / suggest anything (job related)!

Return to work paradigm:

- Same job, same employer
- Different job, same employer
- Same job, different employer
- Different job, different employer (transferable skills)
- Short term training
- Voc rehab

Legal cases

- Indergard v. Georgia-Pacific Corp
- Loma Linda University
- Majeski v. Metropolitan Life ins.
- EEOC v. E.I DuPont: testing not related to PD of an EF
- Key: Be aware
Best resource:
www.roymatheson.com

Physicians sued under ADA for adverse employment decisions

Decisions should be based on:

- Medical knowledge of employee
- Functional Capacity Evaluation based on physical demands of job

Matheson, 2013

Physician Communicates to Employer:

- Safe Medical Restrictions and abilities based on FCE
- Match or Mismatch of Safe Abilities to the Demands of Essential Functions of the Job
- And Return-to-Work Decision
- RA Remediation Opportunities: not usually within skill set of physician

“Red Flags”

- Patient telling doctor can/can't do specific tasks at work
- Inconsistent behaviours / not directly related to dx / ms exam
- Exaggerated behaviours, complaints, pain
- Hesitency / fear re: RTW
- Outlying treatment/time
- Observations / inconsistency

Other issues:

- Can't force a client: Who says stop?
- Document why stopped
- Length of assessment:
 - 1-6 hours, 1-2 days ?
 - Cross, 2007: "less may be better"
- Use consistent system, document deviation
- Injuries should not occur and are not identified as an issue in the literature

Issues (cont)

- No proven formula to extrapolate performance to actual work hours
- But.....must identify ABILITIES even when sub optimal effort provided

So what's the bottom line?

- There is a lot of controversy
- There is no formula
- The therapist can't MAKE anyone do anything!
- The more questions, the better the data
- The more experienced the therapist, the better the eval (hopefully!)

The Best FCE is 40 hours a week for 52 Weeks

In the absence of that, FCE's provide valuable data, research supports that results are meaningful, and findings are better than MD eval alone and/or self report.

Case Studies

On- Site Case Study

- 58 y.o. left dominant LNA
- Right shoulder injury, no sx, MRI shows biceps tear / SLAP lesion
- Extensive therapy, somewhat improved
- Job Shadowing: Varied tasks:

- Continued symptoms
- Continued restrictions
- Employer ready to terminate.....

- Sudden full work release
- Employer concerned, requests intervention
- FCE ordered and done On-site for actual use of equipment:

Method:

- Upper quarter screening
- Standard strength testing
- Specifics of site known
- Actual work tasks:

- Training nurse, head nurse
- Manikin with gait belt
- FJD clarified
- Identified abilities relative to FJD requirements
- Bottom line: returned to work, no problems to date

Case study:

- 41 yo right dominant male
- Auto technician
- FOSH resulted in surgical repair to TFCC
- Extensive therapy, RTW with 15 lbs. lift right hand
- Difficulty with full job tasks

Identified abilities / limitations / suggestions

- Lifting bay door: needed power lift
- Torque of impact driver
- Impacto gloves
- Changing heavy tires: tire lift

Problematic FCE

- 47 yo female auto sales person
- Fell on slippery parking lot, injury to left dominant shoulder, neck, elbow
- Numerous surgeries to elbow / shoulder with limited ROM
- Numerous psychosocial issues
- Employer provided TAD work, employee working full time, modifications provided

FCE requested

Because of subjective complaints at work
To assist with MMI

FCE:

- Relied on employee's description of physical demands
 - Typing time / posture
 - Weights lifted
 - Required duties
- Did not delineate involved from non-involved
- Identified only restrictions

- Resulted in lower ability than actually being performed at job site
- Findings were inconsistent with restrictions:
 - Grip strength: 40 lbs, stated could not pinch
 - Stated could not reach, hand / elbow ROM sufficient to reach forward and to shoulder height
 - Stated could lift only 5 lbs but could carry 10

Key outcomes:

- Consistency: between elements and relative to diagnosis
- Observations
- Correlations and explanations
